ABSTRACT

A bedside organizer for holding various items typically used while in bed. When in place over the bed, the organizer extends from one side of the bed, over the top surface, to the opposite side of the bed. The bedside organizer has two side portions and a middle portion extending therebetween. Each side portion has a top edge, a bottom edge, and a number of pouches extending between the top edge and the bottom edge. Each pouch has a top opening through which items may be inserted. An overlay extends from the top edge of the side portion over the top openings of the pouches. In order to retrieve the items in the pouches, the overlay is raised upward, thereby exposing the top openings of the pouches.
